

How to Transition to a Hydrogen Powered Regional Fleet

A Case Study

SOUTHWEST RESEARCH INSTITUTE®

09-25-2025

How Hydrogen Projects are Born

Electric Vehicles?

Slow recharge time (2X inventory required)

I can't upgrade my power on-site

Hydrogen Vehicles?

Fast refill times

Refueling on-site

From Feasibility to Implementation Logistics

■ Successful Project Implementation:

- Ensure financial viability
- Build your team
- Nurture the region

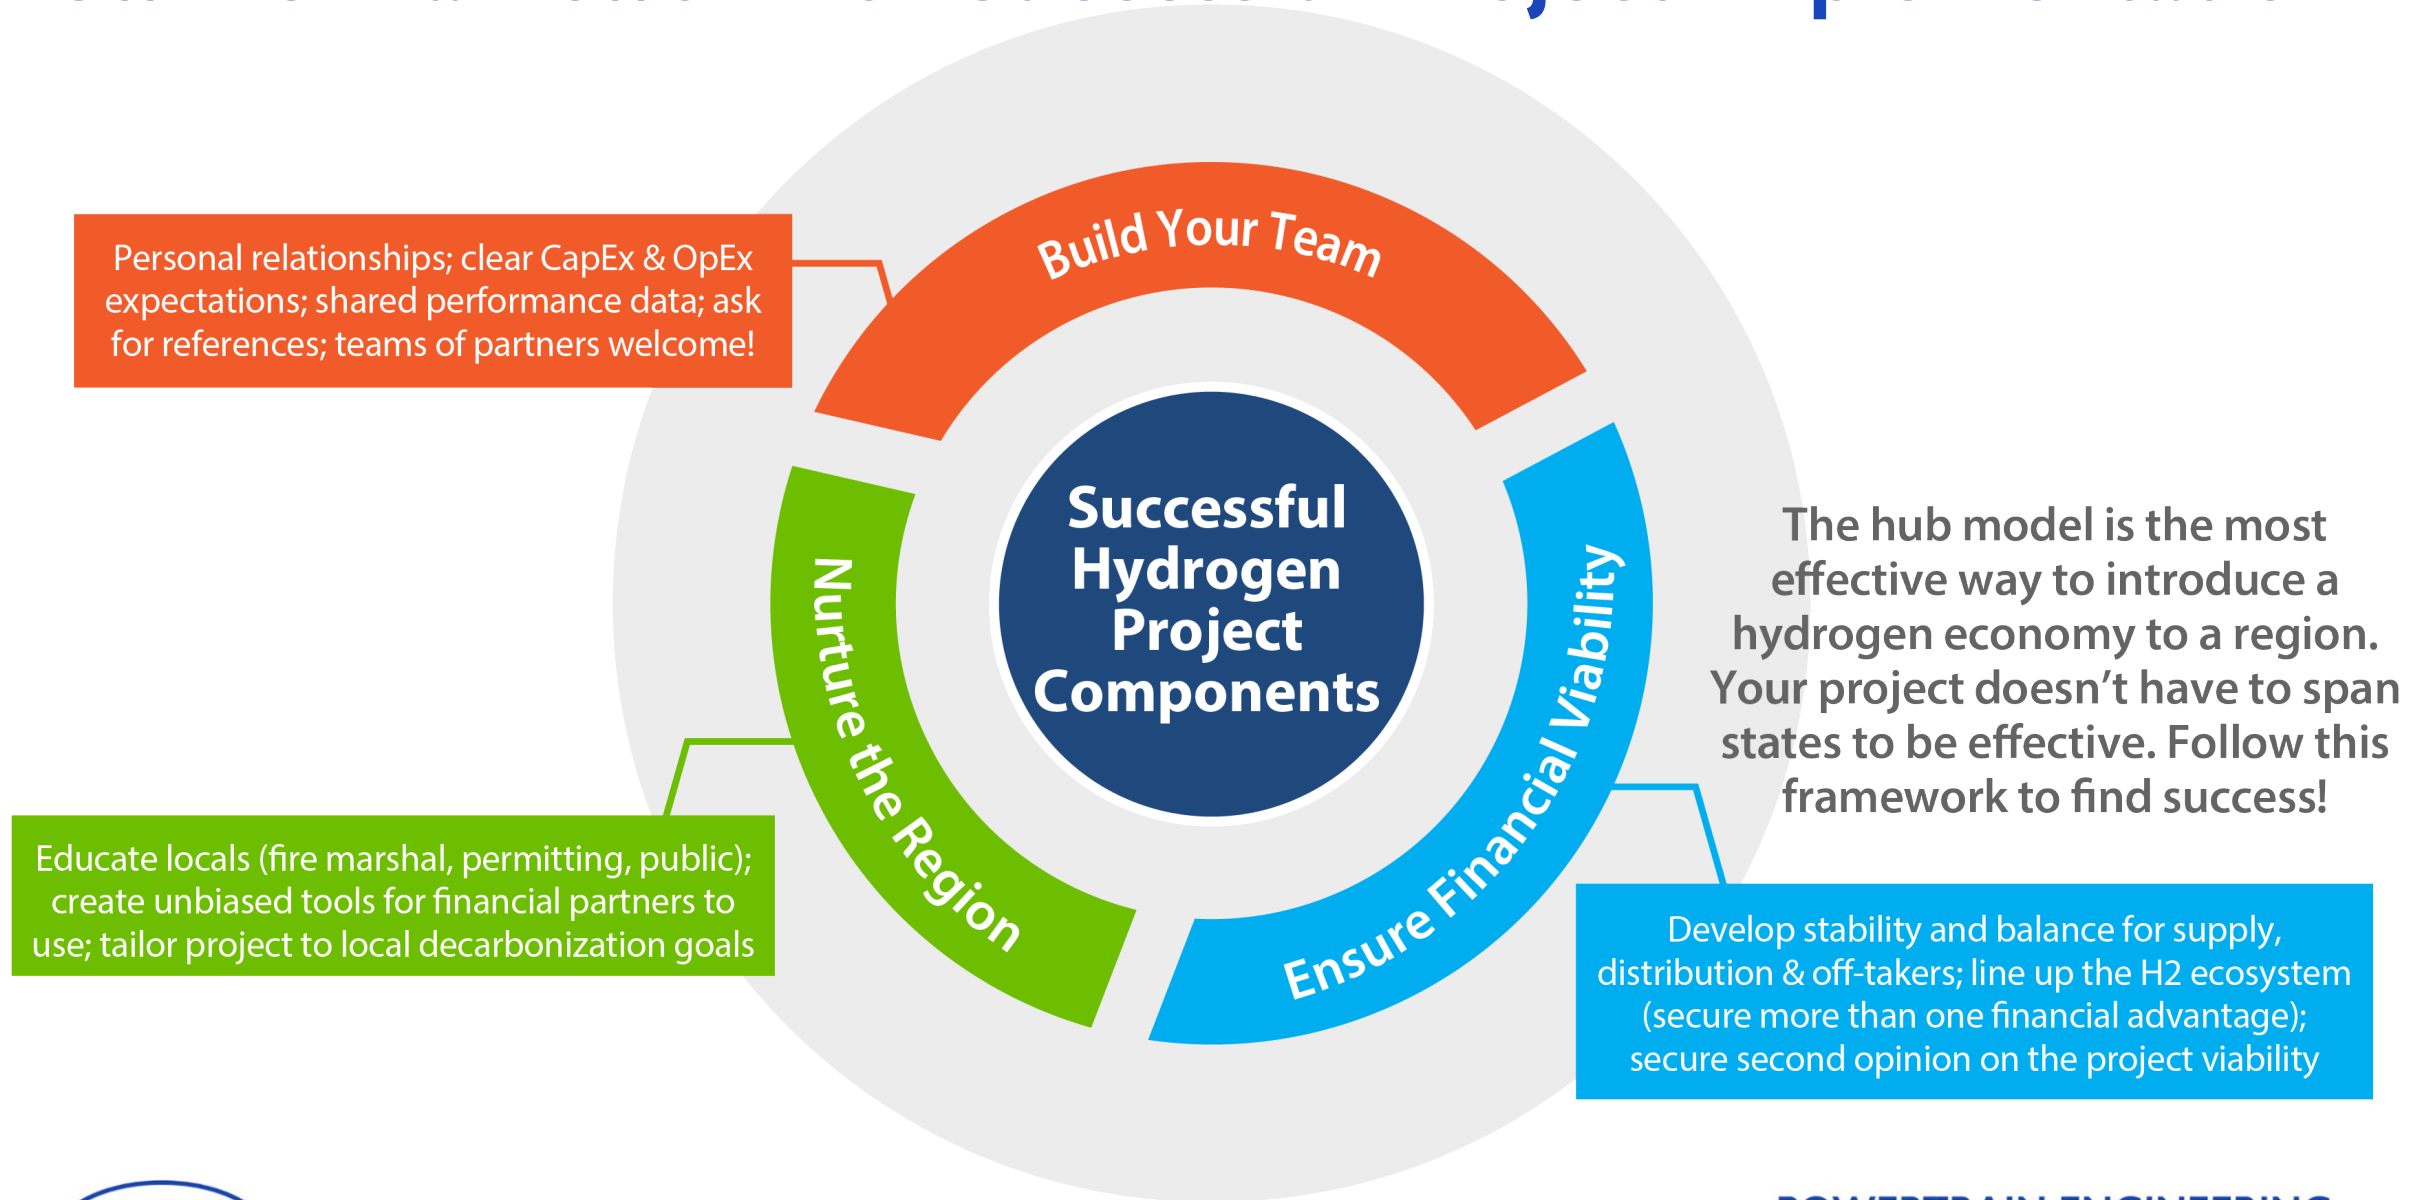

■ Total Cost of Ownership Variables:

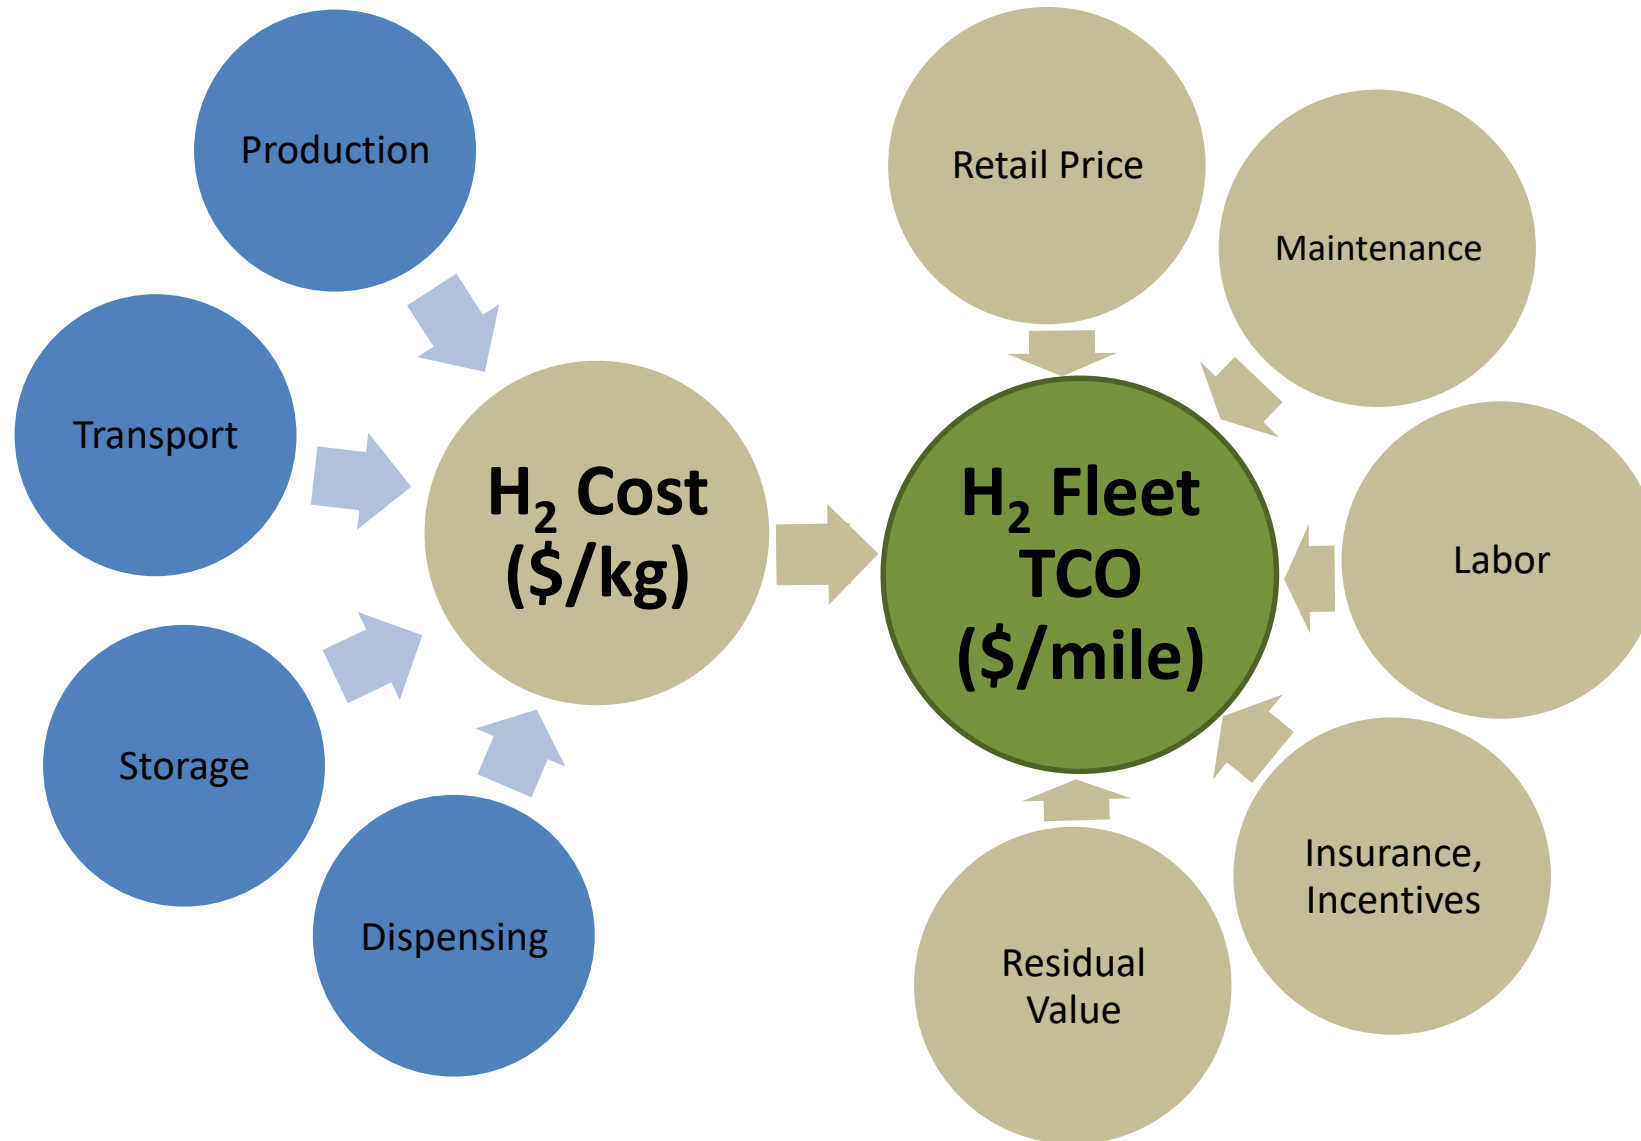

- Geographical region
- Costs along the value chain: production, distribution, end use equipment (CapEx + OpEx)
- Implementation scale

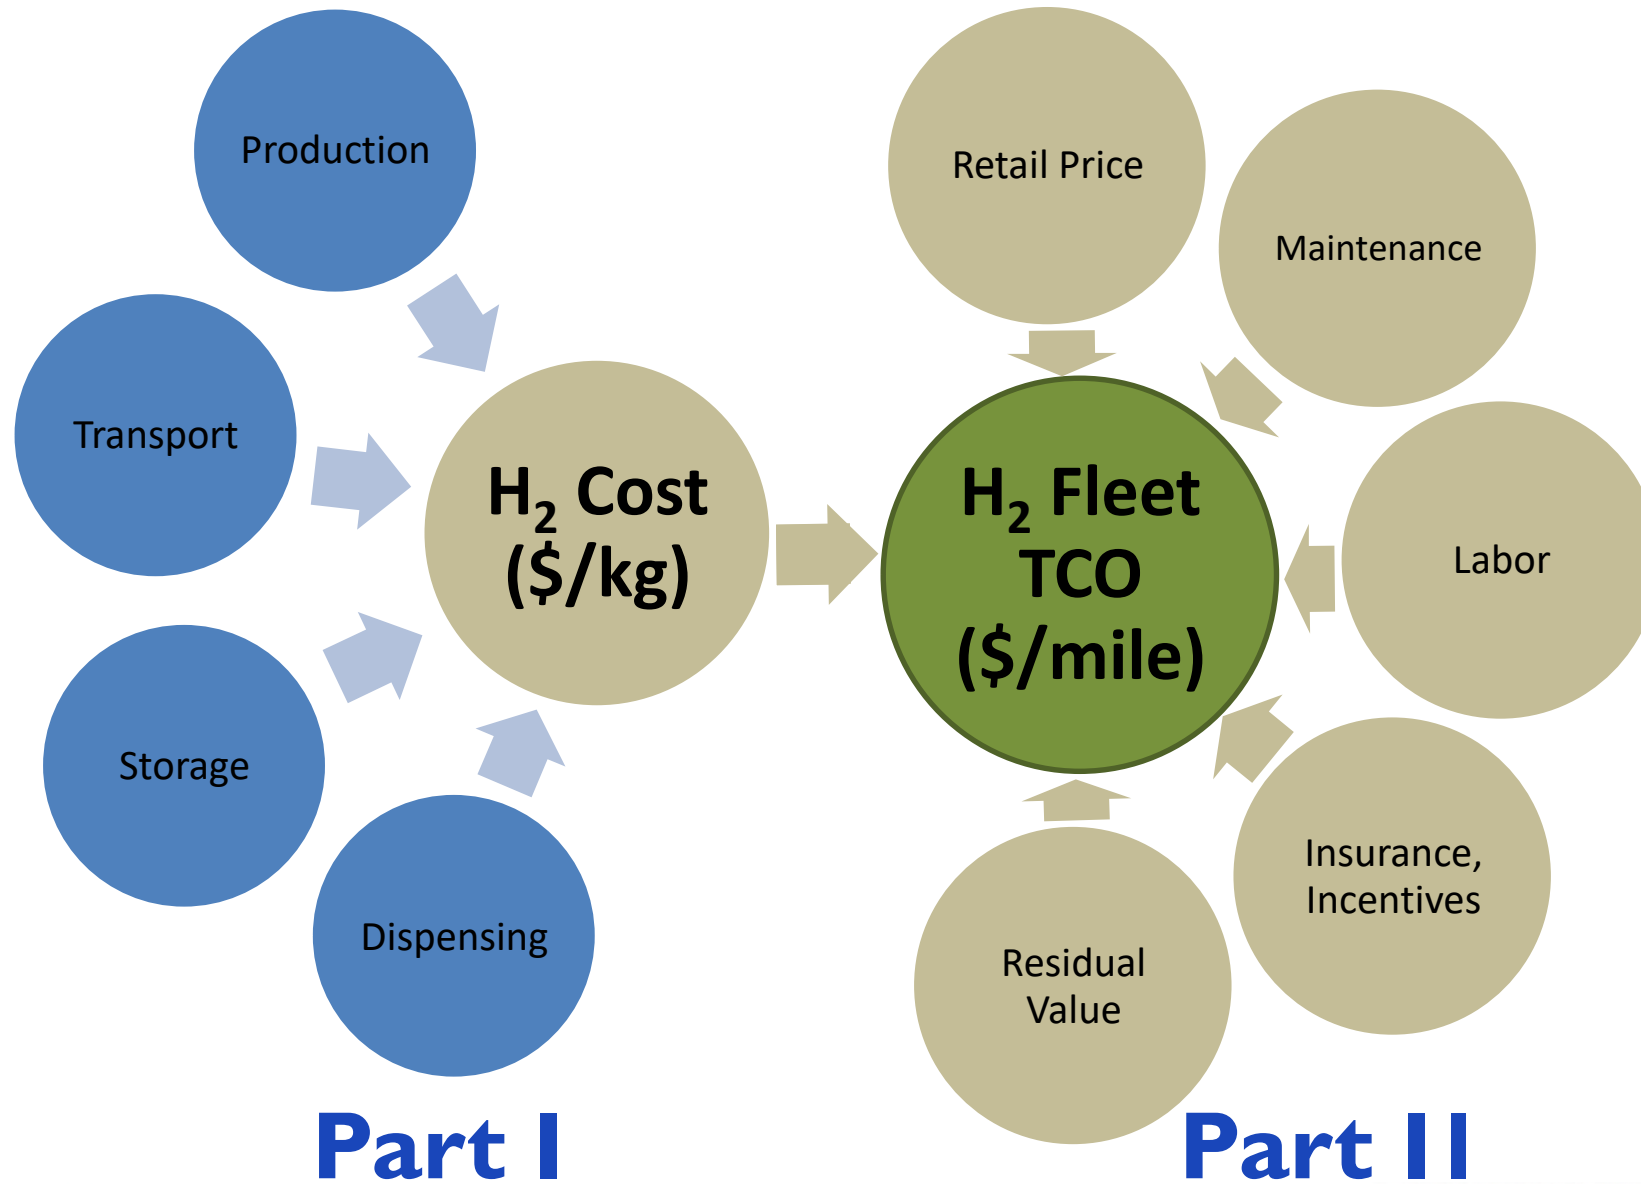

SwRI's Framework for Successful Project Implementation

Calculating TCO of a Hydrogen Truck

Calculating TCO of a Hydrogen Truck

Part I: H2 Cost Estimation

Onsite Production or Delivery?

Hydrogen Cost are Region Specific

- Assumed the hydrogen refueling station (RFS) has a capacity of 1 MT/day - demonstration of 10-13 trucks
- The remainder of produced hydrogen is sold to The San Antonio Refinery (TSAR)
- For carbon capture scenarios, assumed a CO₂ pipeline exists between San Antonio and Houston (plant doesn't become fully operational until 2030)

Map of Carbon Pipelines - American Carbon Alliance. (2025, January 9). American Carbon Alliance. <https://americancarbonalliance.org/map-of-us-pipelines/>

Larson, E., et al. *Net-Zero America: Potential Pathways, Infrastructure, and Impacts Final Report*. Princeton University, Princeton, NJ. October 2021.

Cost Estimating Assumptions and Methodology

Assumptions

- Existing land at CoSA's mulch grinding site can be used to host a hydrogen production plant
- Some biomass pretreating equipment is already owned (front end loaders, grinder, metals screener, truck scales)
- No taxes
- No internal rate of return (IRR)
- If pursued, capital investment is solely through debt financing (bonds, or other)
- The maximum size of a production plant is 20,000 kg H₂/day (limited by the annual biomass processed by the site)

$$LCO''X'' = \frac{(\text{capital cost} \times CRF) + \text{annual O\&M costs} + \text{annual energy costs}}{\text{average annual hydrogen yield in kg}}$$

$$\text{where } CRF = \frac{r(1+r)^n}{[(1+r)^n] - 1}; n = \text{useful life (in years)}; r = \text{discount rate}$$

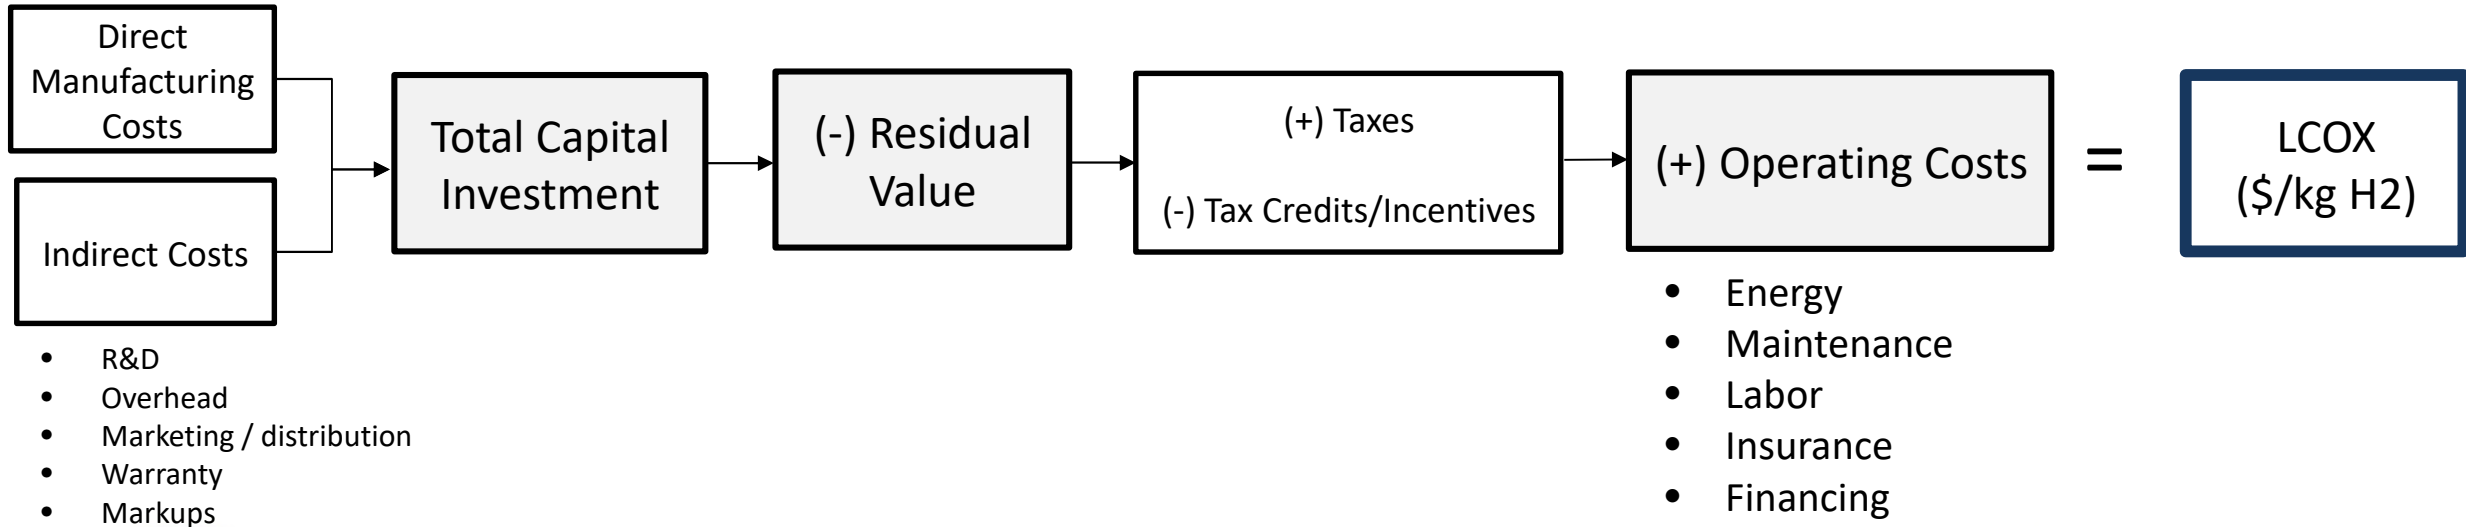

What is the actual cost of hydrogen?

- Actual cost of hydrogen (LCOH) is the sum of the following,
 - Levelized Cost of Production (LCOP)
 - Levelized Cost of Liquefaction and Terminal (LCOL+T), when applicable
 - Levelized Cost of Transport (LCOT), when applicable
 - Levelized Cost of Dispensing (LCOD)

- Information was collected from multiple sources,
 - City of San Antonio WMD
 - Vendor discussions/quotes
 - Equipment correlations
 - Literature trends

- Equipment cost
- Maintenance
- Catalyst cost/replacement

Equation for levelized cost of "X"

Detailed Example of Hydrogen Production Results

Hydrogen Production Results

GH2 or LH2 Delivery

Process	Daily Hydrogen Capacity (kg/day)	TCI (\$/kg/day)	LCOH (\$/kg)
Liquid Delivery	1,000	2,000	\$17.17
Gaseous Delivery	500	10,000	\$30.82
Mobile Gas Refueler	280	8,928	\$19.83

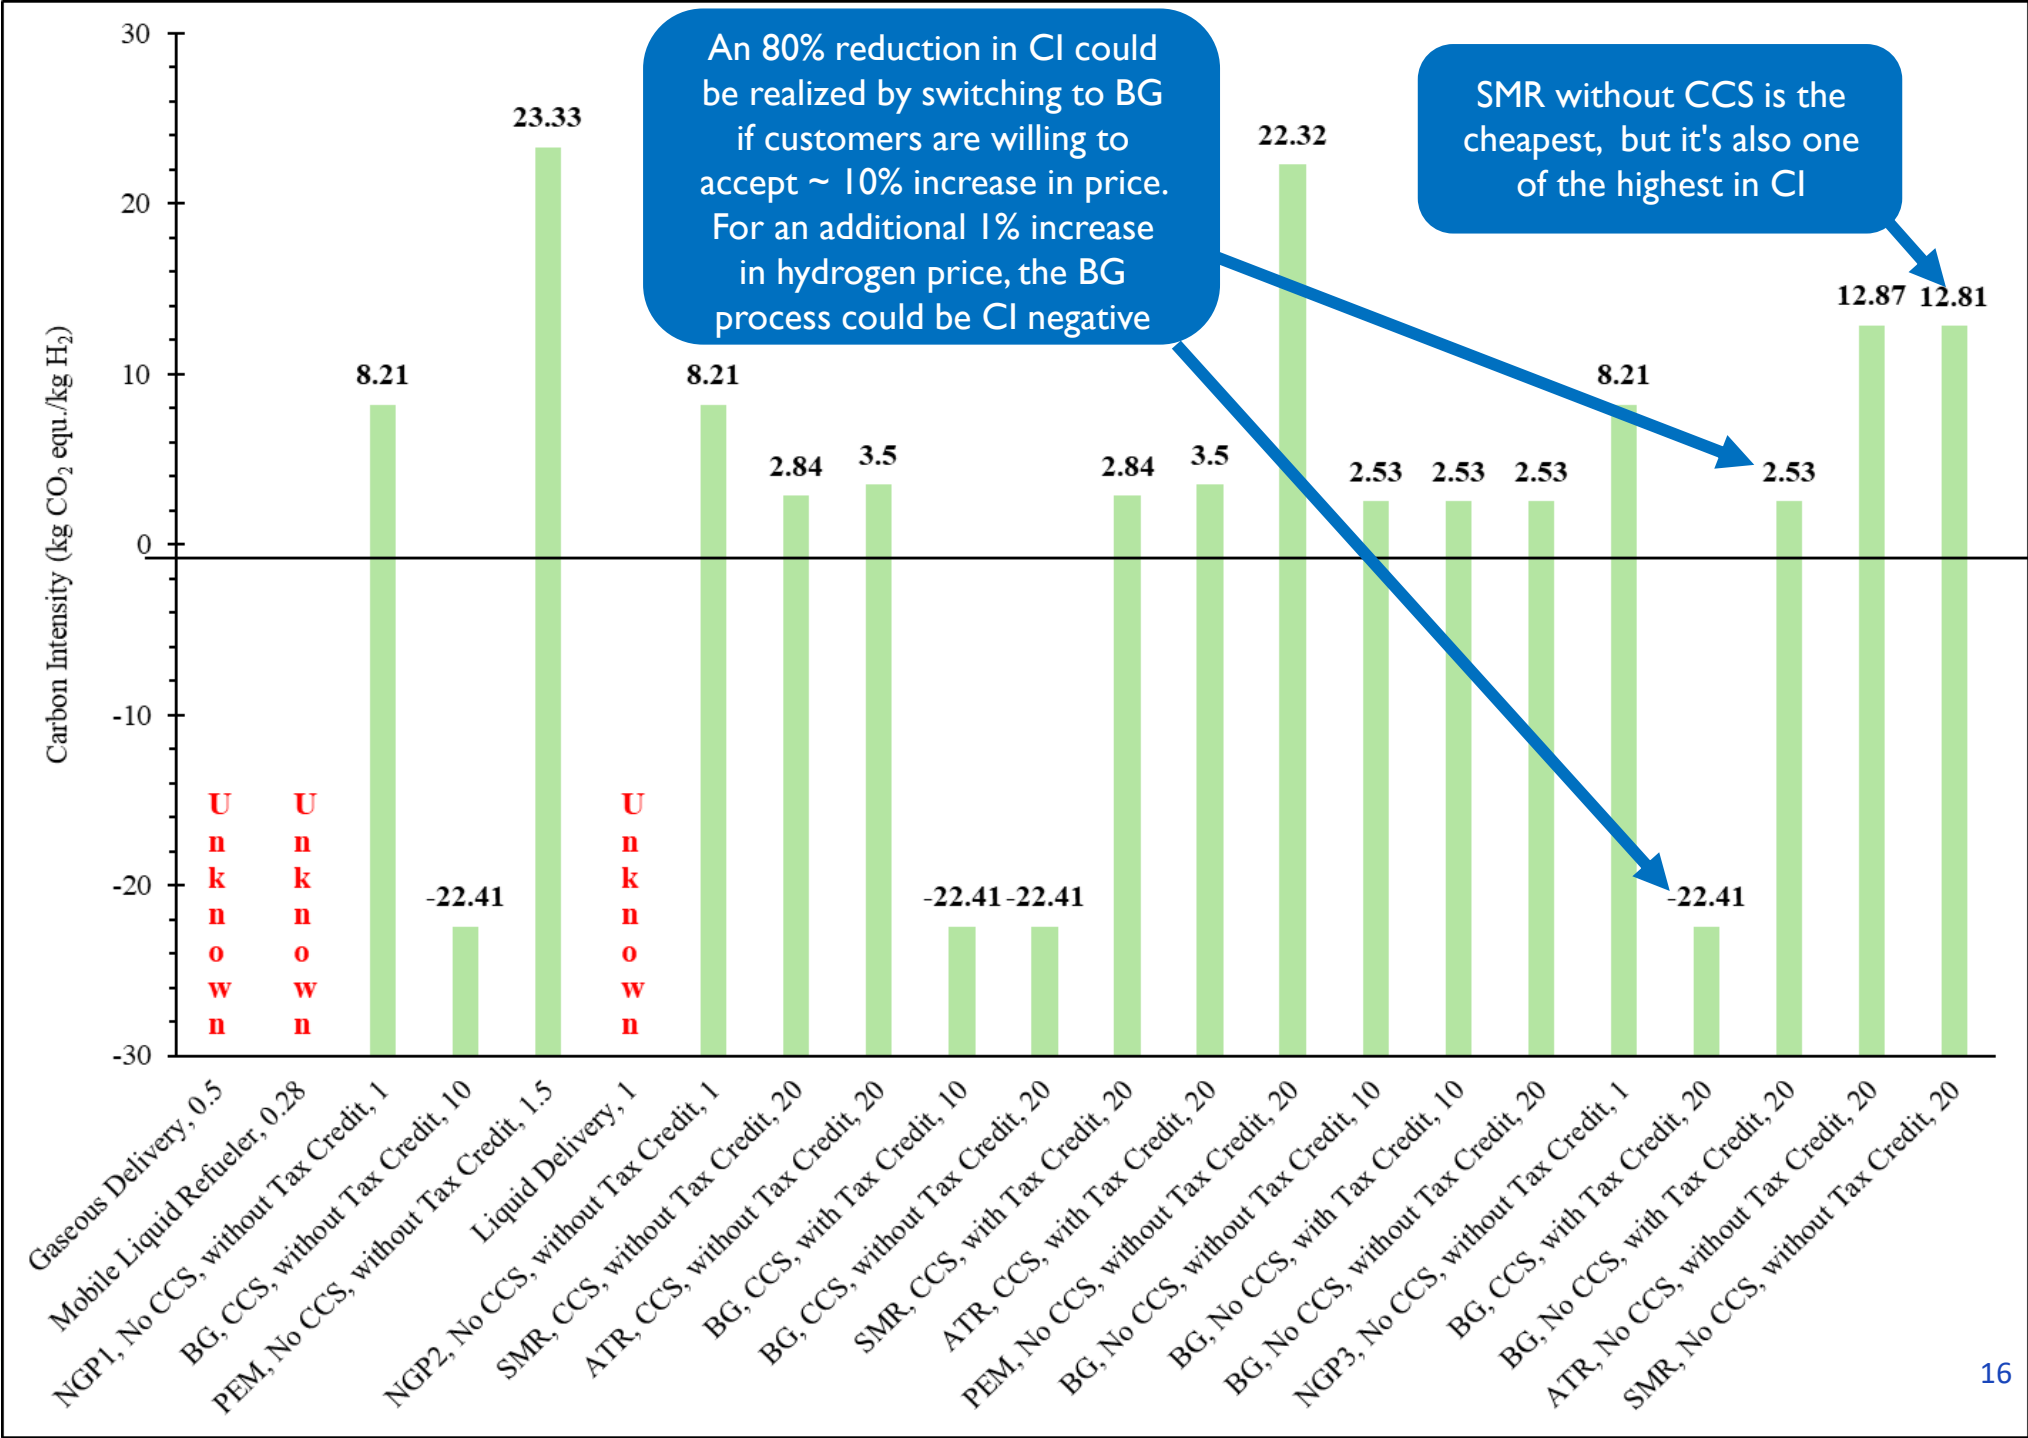

Data from Bracci et al., *Levelized Cost of Dispensed Hydrogen for Heavy-Duty Vehicles*. NREL Technical Report TP-5400-88818. March 2024.

Levelized Cost of Hydrogen at the Pump

Estimated Carbon Intensity

Conclusion

- Low-cost hydrogen requires very large plants to take advantage of economy of scale
 - By increasing production capacity by 100x, the LCOP can be reduced by roughly 75%
- Large plants normally are in rural areas, requiring transportation over longer distances to reach customers
- Transportation over long distances is typically cheaper to accomplish in the liquid phase
- Liquefaction of hydrogen adds additional \$3-\$5 to dispensed hydrogen (dependent on liquefier scale)
- The hydrogen landscape cannot currently support CoSA's decarbonization efforts while remaining on par with diesel prices

H₂ FC or H₂ ICE Trucks?

Both are technically viable, have been demonstrated on a limited scale, and present unique benefits and challenges

SwRI Class-8 H₂ ICE truck

JCB H₂ ICE digger

WM / Hyzon H₂ FC refuse truck

Hyundai Xcient H₂ FC truck

Are H₂ refuse trucks economically viable?

Total Cost of Ownership (TCO)

- The levelized cost of owning a vehicle
- Accounts for all major capital and operational costs incurred over the vehicle's life
- Typically represented in $\frac{\$NPV}{\text{mile}}$

TCO will be used to assess the economic viability of H₂ refuse trucks

Baseline Truck for Case Study Analysis

- Fuel: Diesel
- Range: 150 miles/trip
- Fuel consumption: 2.5 mpg
- Useful life: 8 years
- Retail price (MSRP): \$475,000

TCO of H₂ trucks will be compared to that of a CoSA diesel truck

Fuel Cost

Price:

- H₂: 11 \$/kg [from H₂ supply model]
- Diesel: 2.70 \$/gal [pre-tax, bulk price]

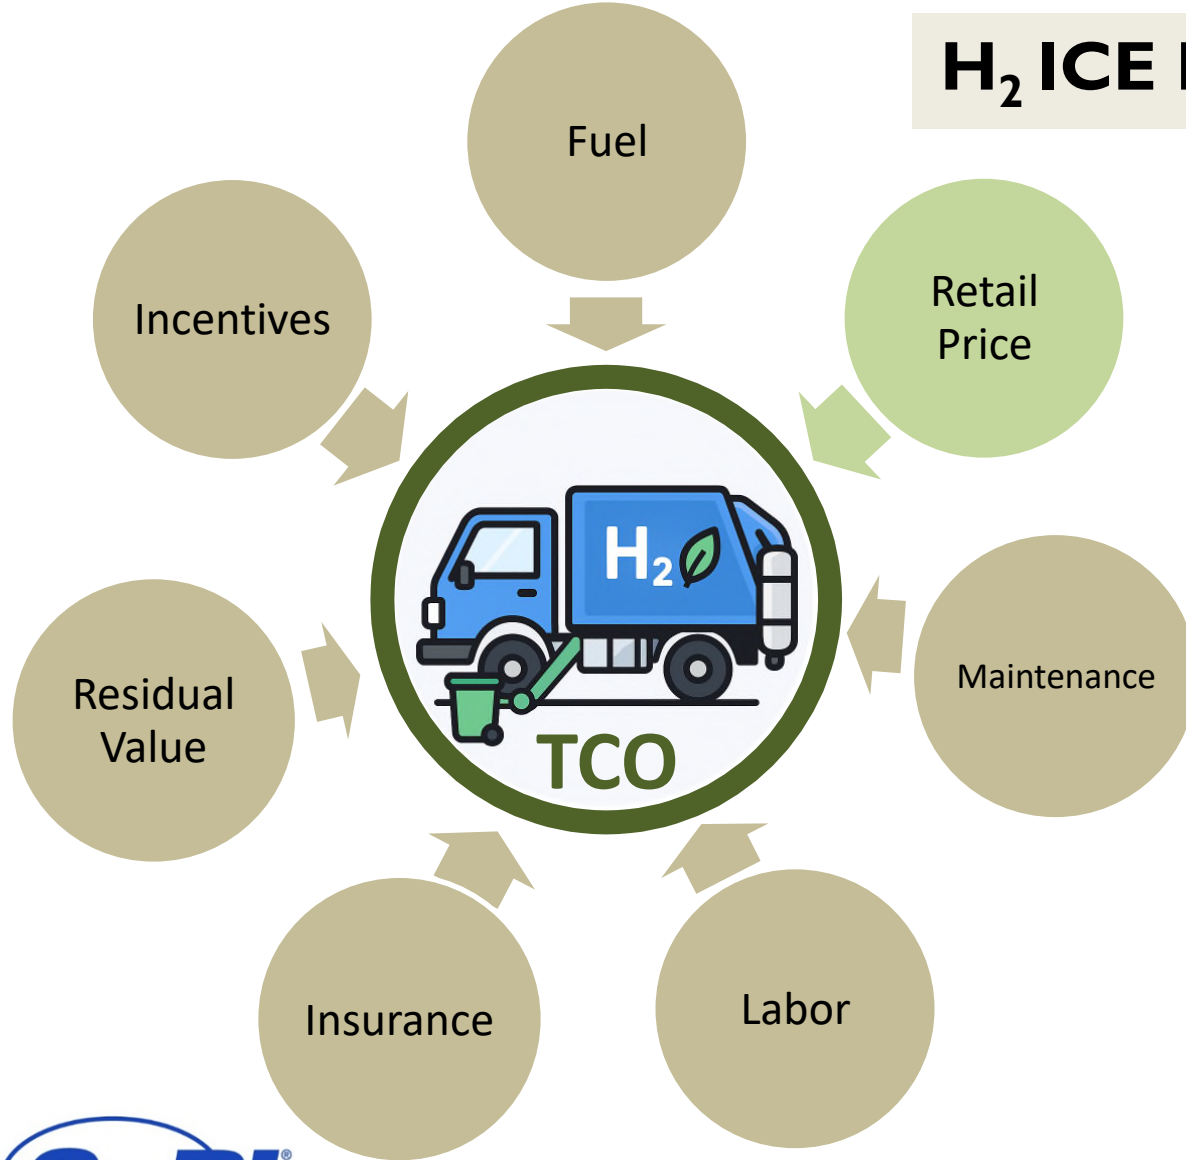

Fuel Quantity:

- H₂ trucks have the same range as baseline (diesel)
- Assumed drive cycle fuel conversion efficiencies:

Diesel	H ₂ ICE	H ₂ FC
35%	33.6% (↓4%)	42% (↑20%)

Retail Price = Manufacturing Cost + Indirect Cost

H₂ ICE MSRP estimated using bottom-up approach

1. Calculated baseline truck manufacturing cost from MSRP (assuming 42% indirect costs)
2. Estimated H₂ ICE truck manufacturing cost by accounting for vehicle systems changes
3. Estimated H₂ ICE truck MSRP by assuming 53% indirect costs

Retail Price = Manufacturing Cost + Indirect Cost

$$\text{H}_2 \text{ FC MSRP} = \underline{2.5} \times \text{Diesel Truck MSRP}$$

- H₂ FC truck MSRP is assumed to be 2.5 times the baseline truck's MSRP
 - based on discussions with stakeholders and literature survey

A spokesperson for New Way said the difference between manufacturing a hydrogen vs a diesel truck is a few hundred thousand dollars. While a diesel side loader would cost around 300,000, a hydrogen side loader would cost approximately 700,000 and could extend up to a million dollars. The cost for both could also be higher or lower depending on the model, type of truck, and systems installed.

Kaur, S. (2024, September 13). *North America's first hydrogen-powered garbage truck debuts in Redwood Shores: Cleaner, but costly.* Mountain View Voice.

Maintenance Cost

- \$475,000 over lifetime

Labor Cost

- 32 \$/hr, 10 hrs/day, 1 person/vehicle

Insurance Cost

- $[3\% \text{ of Vehicle Price}] + [\$0.065 * \text{Miles/Year}]^*$

Residual Value

- 5% of retail price at end-of-life (year 8)

Used same assumptions for H₂ FC and H₂ ICE

"TCO of alternative powertrain technologies for Class 8 long-haul trucks in the United States." ICCT (2023).

Incentives

■ IRA's "Clean Commercial Vehicle Credits" [Discontinued]

Nominal Incentive Scenario

- Up to **40,000 \$/truck** for FC trucks
- H₂ ICE trucks not eligible

North Central Texas
Council of Governments

■ North Texas Zero Emissions Vehicles Project [\$60 million]

High Incentive Scenario

- H₂ FC Class 6 and 7 trucks
- **Lower of \$600,000 or 70% of MSRP** / truck
- Call launch in Fall 2025

TEXAS COMMISSION ON
ENVIRONMENTAL QUALITY

■ Texas Hydrogen Infrastructure, Vehicle, & Equipment (THIVE) [\$16 million]

- H₂ FC / ICE trucks with 25% lower NO_x
- Up to **100%** of incremental cost
- Projected Opening: January 2026

City of San Antonio Refuse Truck TCO Case Study Results

Important Assumptions

- H₂ price: 11 \$/kg
- H₂ FC incentive: 40,000 \$/truck
- H₂ ICE incentive: 0 \$/truck

TCO Results

- MSRP, labor and fuel costs are the largest costs
- Fuel cost is the largest cost for the H₂ trucks

TCO Comparison

H₂ ICE: 1.81X baseline truck

H₂ FC : 1.95X baseline truck

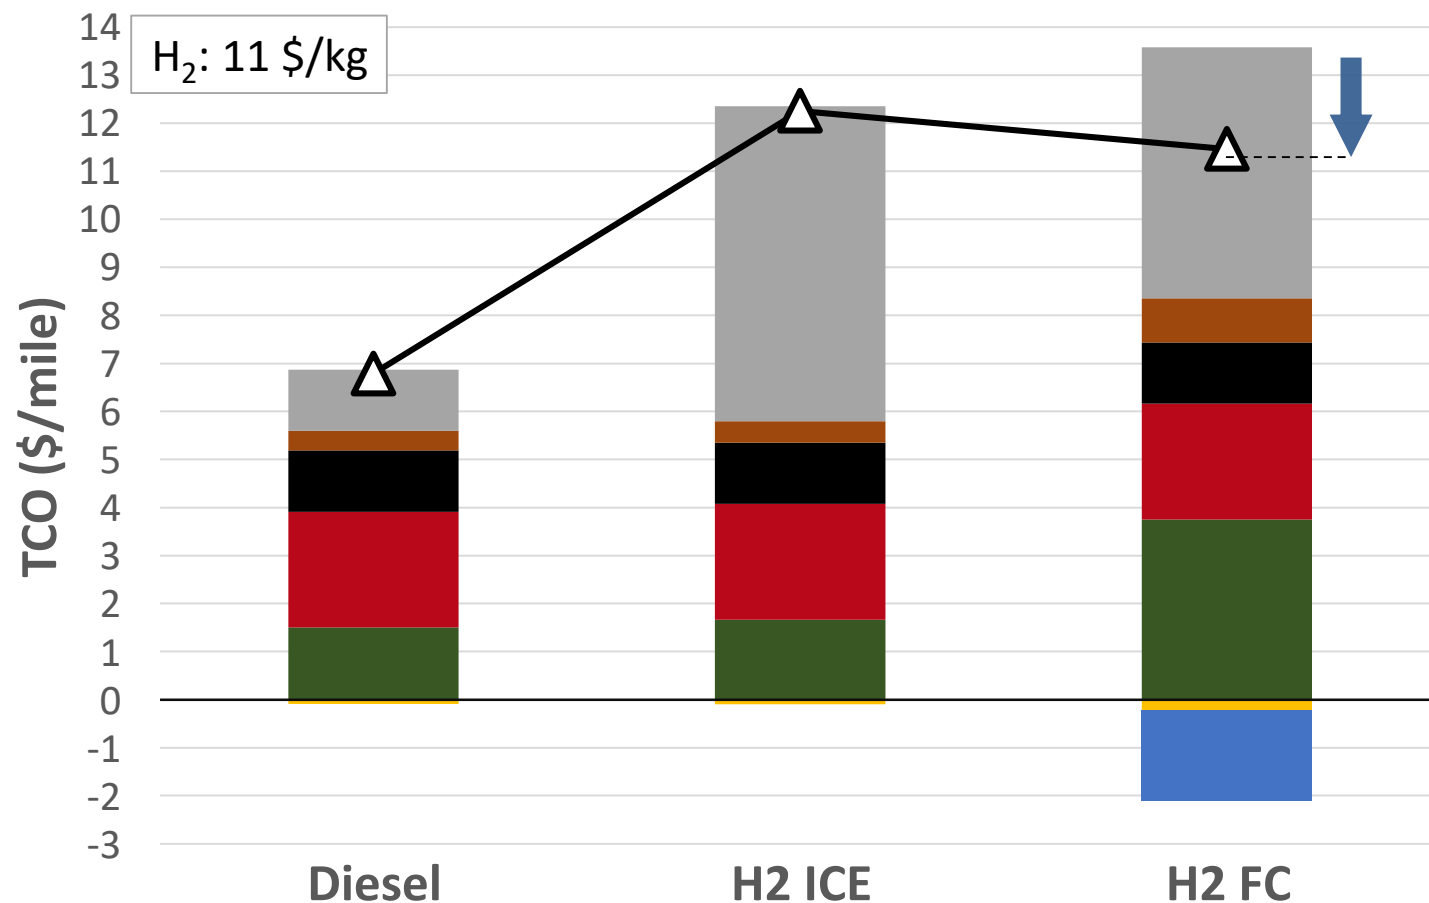

“High” Incentive Scenario

Incentive :
Scenario

		Nominal	High
	H ₂ ICE 0 \$/truck	H ₂ FC 40 k\$/truck	H ₂ FC 600 k\$/truck
TCO	1.81X	1.95X	1.69X (7%↓)
TCO (Non-Fuel)	1.04X	1.46X	1.13X (10%↑)

TCO results relative to diesel truck

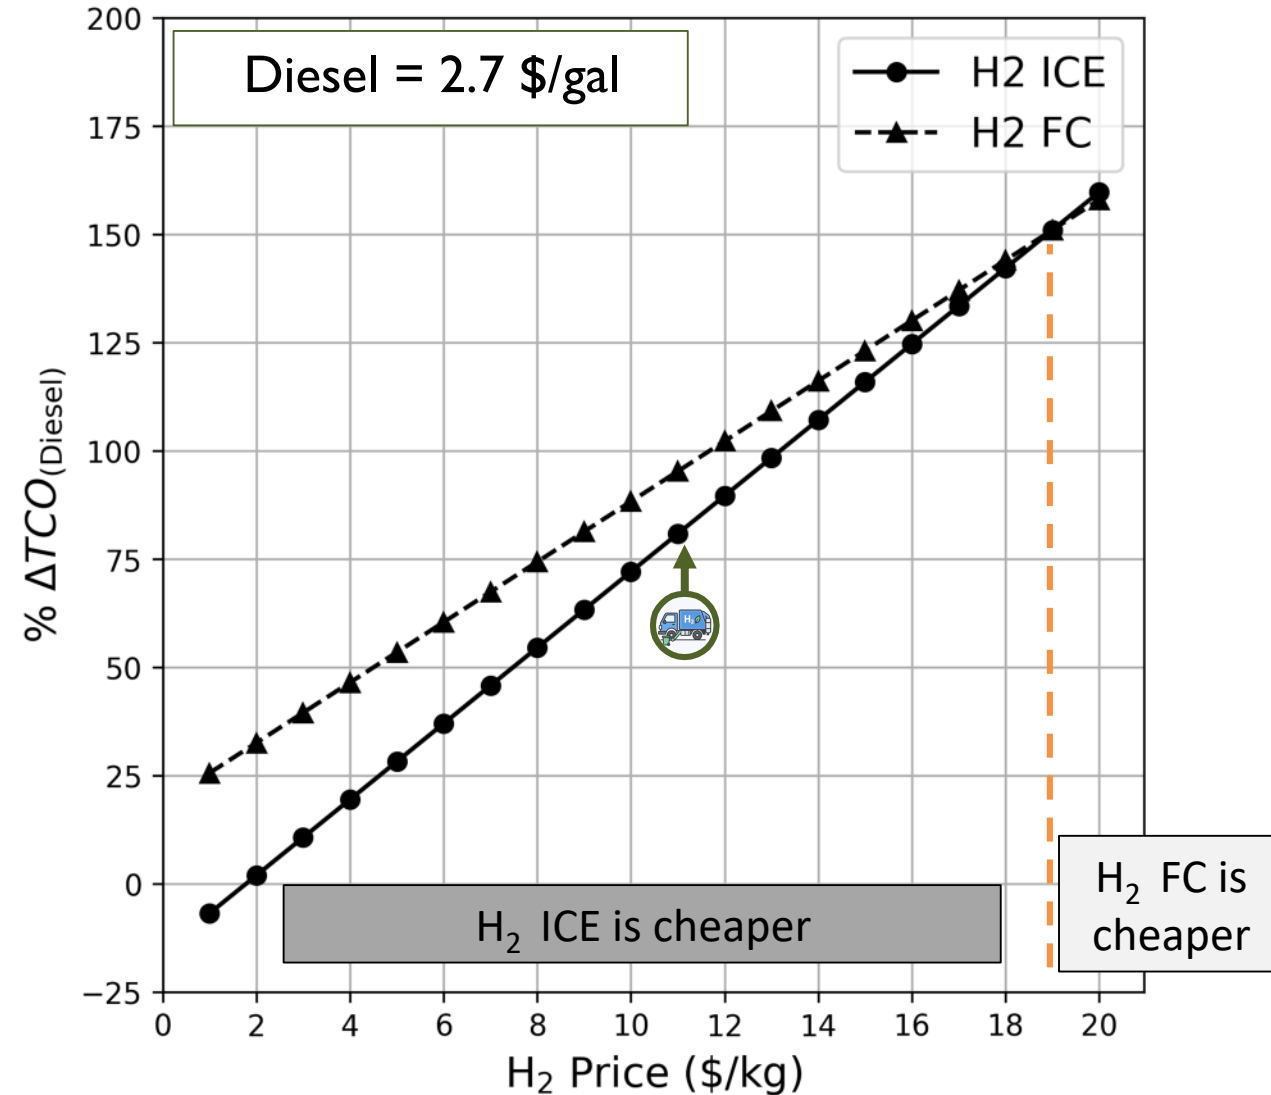

H₂ Price Sensitivity

$$\Delta TCO_{(Diesel)} = \frac{TCO_{H_2 Truck} - TCO_{Diesel}}{TCO_{Diesel}}$$

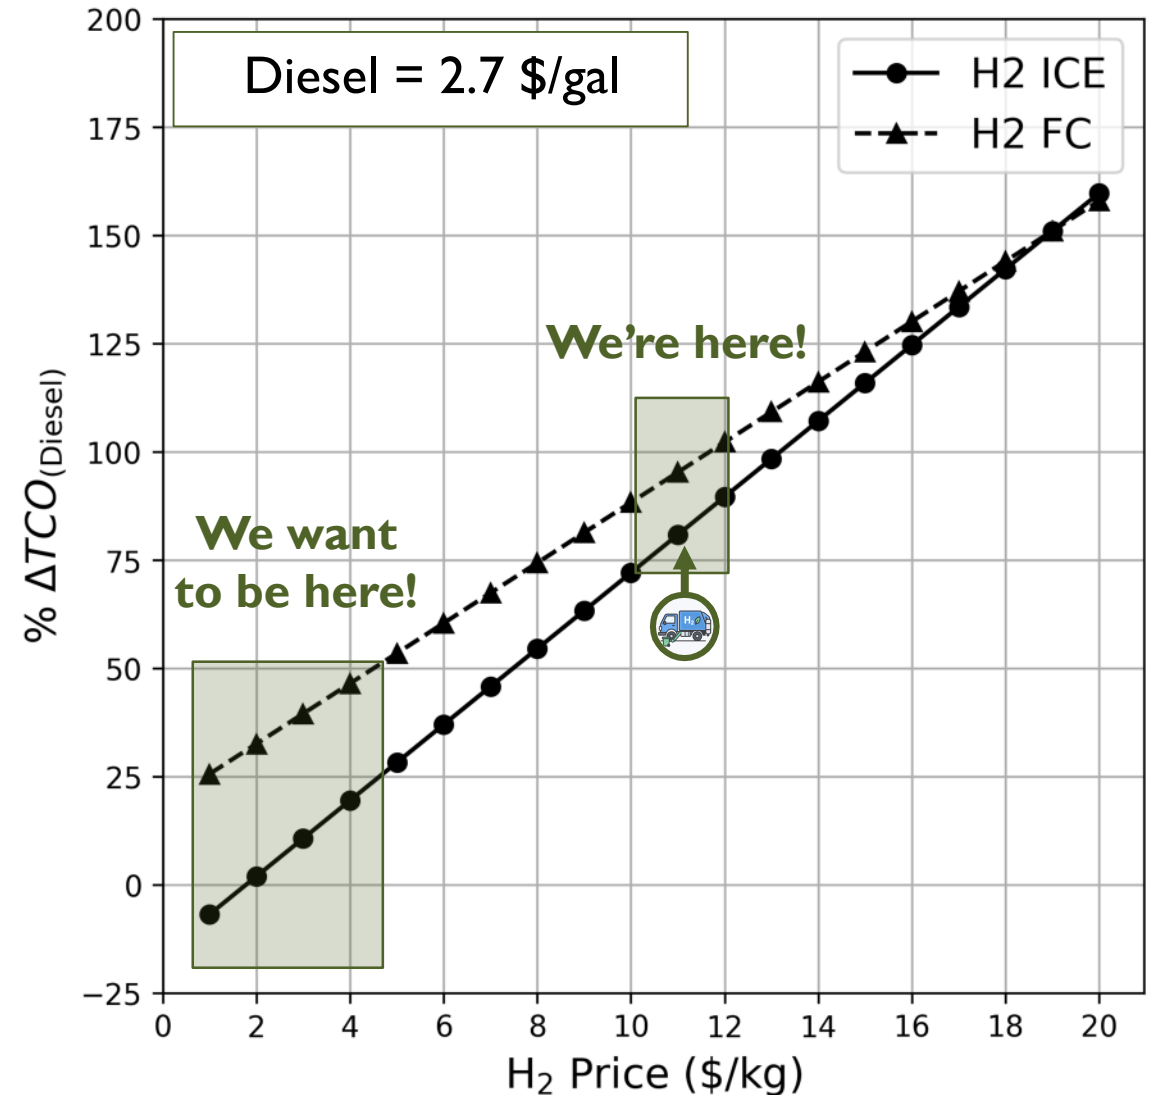

When to Use H₂ ICE and H₂ FC?

- H₂ ICE has lower TCO below 19 \$/kg_{H2} because of its lower retail price
- Above this, H₂ FC has lower TCO because of its higher efficiency

TCO Takeaways

- At H_2 supply price of 11 \$/kg, H_2 refuse truck TCO is roughly twice that of a diesel truck
- H_2 truck costs as much as 2 diesel trucks**
- However, if H_2 is sourced at **lower costs**, H_2 trucks can become economically viable,
 - H_2 ICE trucks have lower TCO than H_2 FC because of lower vehicle costs
- Substantial government incentives** will be needed to make H_2 trucks economically viable

TCO Model Conclusions

TCO costs are region specific and depend on many factors

H₂ Costs depend drastically on scale.

Distribution methods heavily affect H₂ cost

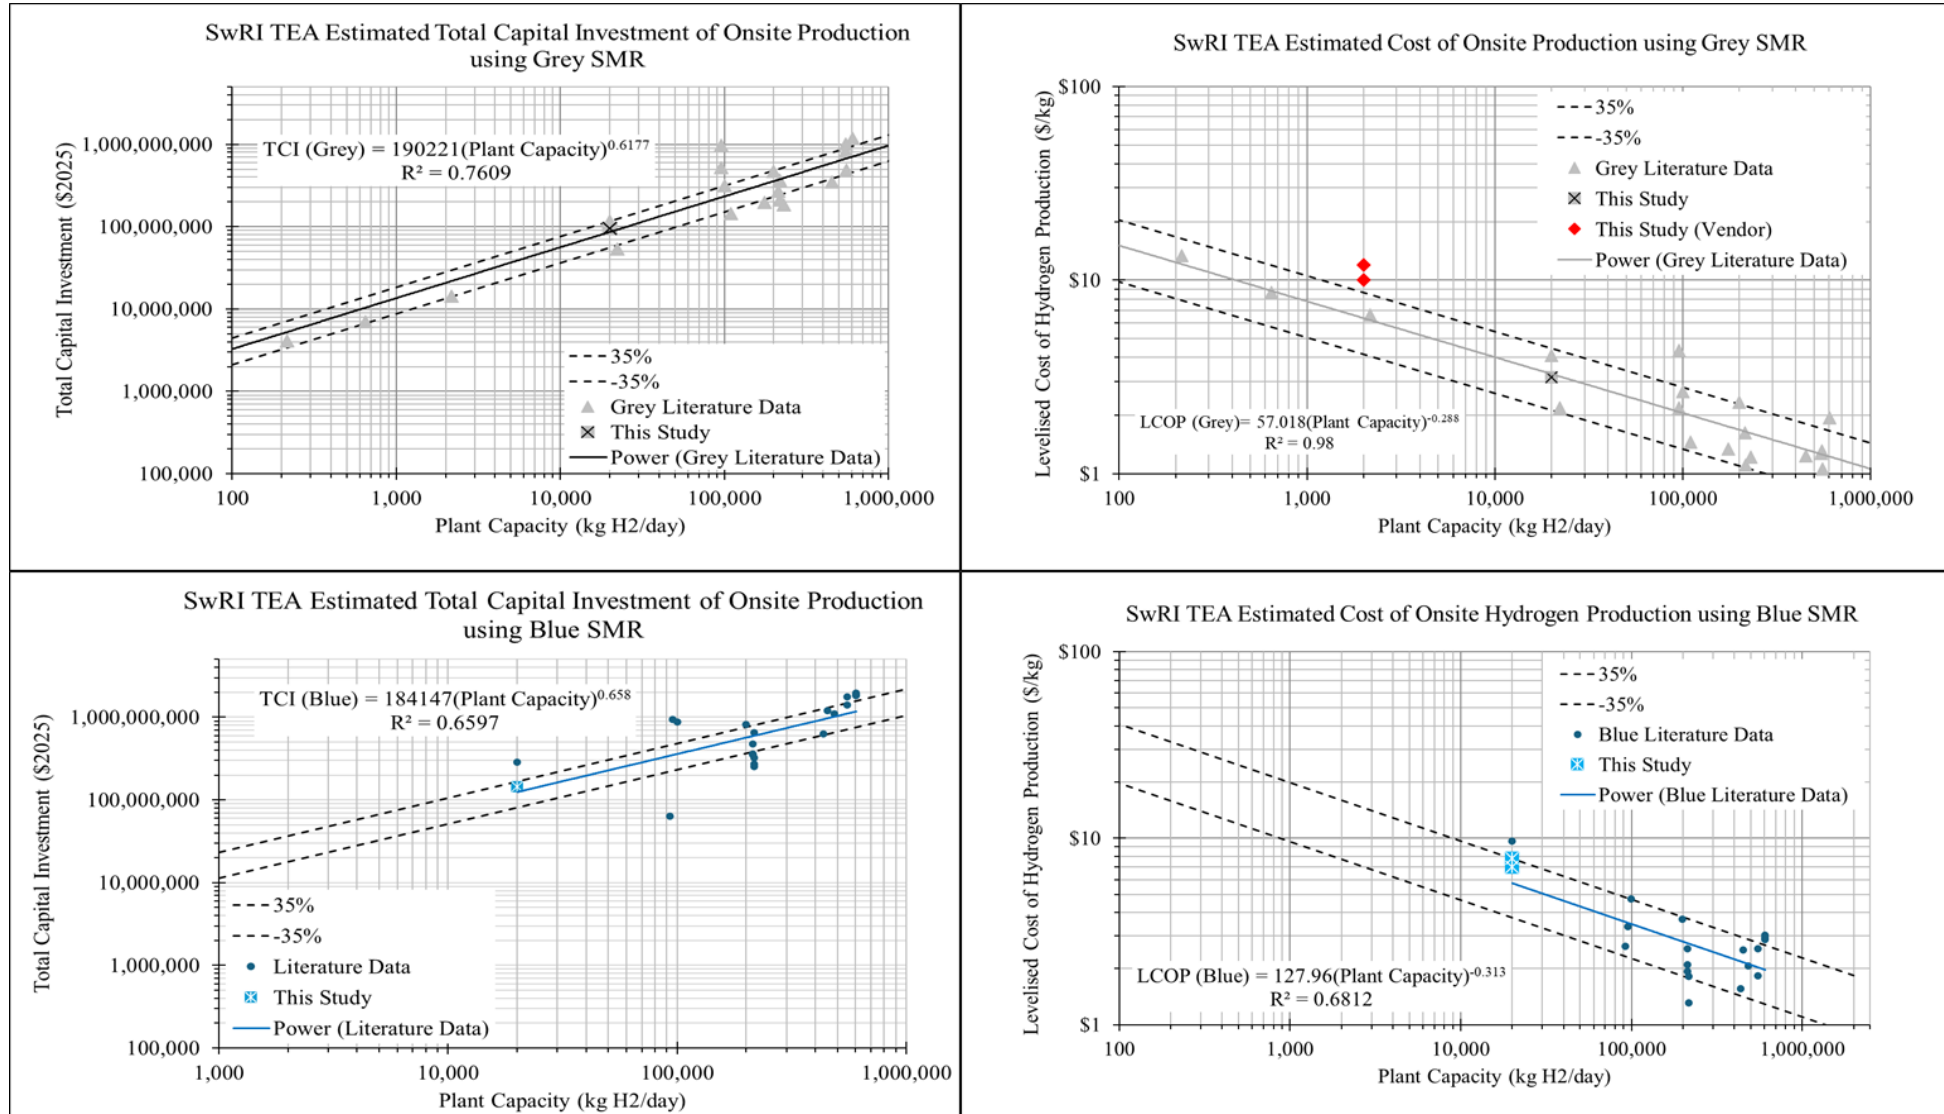

H₂ICE vs. FCEV choice depends strongly on cost of H₂

Each region could follow the HUB model:
It just needs to be designed.

General Process Trends

Levelized Cost of Liquefaction, Terminal, and Delivery

- Data from Bracci et al., *Levelized Cost of Dispensed Hydrogen for Heavy-Duty Vehicles*. NREL Technical Report TP-5400-88818. March 2024.

Levelized Cost of Dispensing

- Data from Bracci et al., *Levelized Cost of Dispensed Hydrogen for Heavy-Duty Vehicles*. NREL Technical Report TP-5400-88818. March 2024.

Vehicle Weight Results

- Around 1500 kg increase in weight because of H2 cylinders
 - 8 for H2 ICE
 - 7 for H2 FC
- Assuming half-loaded truck as $(GVWR + \text{Curb Weight})/2$, the final weight is less than the GVWR, which is 40,000 kg but for full loading applications, there will be around a 2000 kg payload penalty

Class 1 - 6,000 lbs & Less

Class 2 - 6,001 to 10,000 lbs

Class 3 - 10,001 to 14,000 lbs

Class 4 - 14,001 to 16,000 lbs

Class 5 - 16,001 to 19,500 lbs

Class 6 - 19,501 to 26,000 lbs

Class 7 - 26,001 to 33,000 lbs

Class 8 - 33,001 lbs & Over

Insurance Cost

- $\text{Annual Insurance Cost} = [\text{Comprehensive Collision}] + [\text{Liability}]$
- $\text{Annual Insurance Cost} = [3\% \text{ of MSRP}] + [0.065 * \frac{\text{VMT}}{\text{Year}}]$
- Assumed same for all powertrains

Insurance

Insurance costs for tractor-trailers can be a significant TCO component. This study considers comprehensive and collision insurance in addition to liability insurance. The former is an annual cost estimated to be around 3% of the truck purchase price, and

17 ICCT WHITE PAPER | TOTAL COST OF OWNERSHIP OF ALTERNATIVE TECHNOLOGIES FOR CLASS 8 TRUCKS

the latter is calculated as a fixed per-mile cost at \$0.065/mi, similar to Burnham et al. (2021). This approach distinguishes between different powertrain technologies with different retail prices, and also distinguishes between different truck annual VMT.

- Almost half the range and half of H₂ consumption

b. Range

Hydrogen fuel provides all the energy needed by the zero emission fuel cell refuse truck to meet the range requirements without encumbering the RCV with heavy batteries (which can reduce payload).

For refuse collection, with high energy requirements despite typically very low speed and distance, we found that required duration (hours) of operation is a better metric than range (km) of operation. This is reflected in the TCO work presented later in this paper.

For this study, we modeled fuel cell RCVs with 30kg of hydrogen to provide more than 16 hours of refuse collection for both the arc and node duty cycles, Table 3.

Based on typical energy requirements of the arc duty cycle, Arcola estimates the fuel cell RCV with 30kg of hydrogen

can complete a duty cycle of more than 125km containing more than 3,000 bin lifts before reaching 90% depletion of the hydrogen tanks. Just 30kg of hydrogen opens the possibility of zero emission operation over multiple shifts without unproductive stops for opportunity charging of batteries. And 30kg of hydrogen requires less than 10 minutes to refuel. This high-utilisation capability of the RCV asset is an important differentiating characteristic of fuel cell solutions.

The flexibility of the fuel cell RCV to complete short and long duration arc and node duty cycles coupled with the capability to operate multiple consecutive shifts per day presents opportunities for waste management companies to complete the workload with fewer vehicles and a consistent mix of trucks, thereby reducing the total cost of operations. This is an important point that we recommend operators and local authorities study for potential cost savings.

- $FC_\$ = 1.65 \times \text{Diesel}_\$$
- But, FC is 1.5x more efficient, hence larger engine assumed than needed
- If FC is 1.2x more efficient, and cost of engine decreases proportionally with size, $FC_\$ = 2 \times \text{Diesel}_\$$

Table 5: TCO Inputs
